(54) Title: WEB-BASED SYSTEM TO FACILITATE PURCHASE, PICK-UP, AND DELIVERY OF, AND ESCROW AND PAY-  
MENT FOR, MERCHANDISE

(57) Abstract: A Web-based purchasing method using a networked computer system (100) to facilitate the purchase of merchandise by a purchaser (130) from a seller (140). The system receives a purchase offer from the purchaser to purchase a merchandise at an established purchase price. The system (100) then transmits a request to a shipper to pick the merchandise from the seller (140) and an amount at least equal to the established purchase price is transferred from the purchaser's financial account into an escrow account (120). The escrow account (120) is being controlled by a transaction computer (110) based on information contained in the transaction database (116). After the merchandise is delivered to the purchaser (130) at the purchaser's address, and following an inspection period, at least a portion of the gross purchase price is transferred from the escrow account to the seller's financial account as well as to other participants of the web-based purchasing system.

1           **WEB-BASED SYSTEM TO FACILITATE PURCHASE, PICK-UP, AND**  
2           **DELIVERY OF, AND ESCROW AND PAYMENT FOR, MERCHANDISE**

3  
4           **Cross Reference to Related Application**

5           This application is a continuation-in-part of U.S. application serial number 09/393,730,  
6           filed September 10, 1999.

7  
8           **Field of the Invention**

9           The present invention relates generally to electronic commerce, and, more particularly, to  
10          a method and system for enabling commerce over a large public network that includes  
11          capabilities for electronically integrating pick-up and delivery of, and escrow and payment for  
12          merchandise.

13  
14          **Background of the Invention**

15          Increasingly, individuals and businesses are desirous of selling their products and  
16          services in an automated fashion using a large, networked computer system such as the Internet.  
17          As the number of people worldwide who have access to the Internet (and particularly the World  
18          Wide Web portion of the Internet) increases, the Internet is expected to grow and become one of  
19          the world's most significant new marketplaces. Currently, the vast majority of electronic  
20          commerce, that is the buying and selling of information, products and services over computer  
21          networks, is business-to-business. However, one particular e-commerce market segment that is  
22          growing almost exponentially each year is individual-to-individual, or so-called peer-to-peer,  
23          transactions. Individual-to-individual commerce can take many forms including, for example,  
24          the various auction websites available on the Internet. Others who may participate in the  
25          individual-to-individual commerce market include merchants for antiques and collectibles,  
26          memorabilia enthusiasts, home crafters, sporting and entertainment season ticket holders, family  
27          households, and the like. There exists, however, several barriers to this market segment's ability  
28          to effectively conduct commerce over the Internet.

29          One drawback to the increased use of the Internet in this individual-to-individual market  
30          segment is that the participants often have no means of electronically transferring payments from  
31          the buyer to the seller. While conventional businesses typically use credit cards, debit cards, or  
32          other forms of payment, sellers, particularly individuals and small businesses, have limited  
33          means to establish relationships with credit card companies and other similar financial

1 institutions. The need for a conventional merchant account in order to accept payment with a  
2 credit card impedes commerce on the Internet because an average individual Internet user may  
3 have a difficult time qualifying for such a merchant account.

4 Additionally, the parties to an individual-to-individual transaction often do not have a  
5 relationship with a pick-up and delivery service. Because many potential participants in the  
6 individual-to-individual market segment typically ship a small amount of packages on an annual  
7 basis, they lack the power and ability to negotiate preferred rates with such delivery services.  
8 Furthermore, commercial pickup and delivery services require individuals to pay for shipping  
9 with cash only. Individuals may pay for shipping services with check or credit card (noncash  
10 payment) through a third party facilitator. However, facilitators currently require that the  
11 packages be delivered from the facilitator's location; thus requiring individuals to transport their  
12 packages to the facilitator's location for shipping. Currently, independent third parties cannot  
13 arrange for delivery of a package from a first party to a second party.

14 One significant problem with e-commerce in general is the instance of fraud. This is  
15 particularly problematic in the individual-to-individual market because often there is no  
16 established trust relationship between the parties to such a transaction. One possible solution to  
17 the fraud problem is the use of a third party escrow service that holds the payment until the  
18 purchaser is satisfied in exchange for a fee. While escrow services are generally available for  
19 electronic commerce transactions over the Internet, the available services are not seamlessly  
20 integrated into the entire purchasing process and, in particular, are not tied directly into the pick-  
21 up and delivery of the merchandise. None of these existing online escrow services provide more  
22 than the escrow function and all require telephone or other authorization from the buyer before  
23 the escrowed funds are distributed. In each instance, pick-up and delivery must be separately  
24 arranged and paid for by the parties to the transaction. Also, even if an individual were capable  
25 of accepting payment by a credit card, presently most credit card companies do not allow the  
26 settlement of funds from a buyer's account until actual shipment of the goods ordered is  
27 complete. This puts the merchant or seller at risk that the purchaser will not have sufficient  
28 funds or credit availability to complete the transaction.

29 Accordingly, there is a need for a system that facilitates the purchase of merchandise  
30 over a networked computer system that fully automates the negotiation, fulfillment and payment  
31 aspects of electronic commerce. A preferred system would link and automate the entire

1 commerce process, permitting buyer and seller to arrange and complete the agreed-upon  
2 transaction without ever leaving their computer terminals.

### 3 4 Summary of the Invention

5 A system having these features and satisfying these needs has now been developed. The  
6 present invention is a fully electronically integrated web-based purchasing system that links and  
7 automates every stage of a transaction in the e-commerce cycle. The system facilitates an e-  
8 commerce transaction between a seller and a purchaser by providing the means to allow the  
9 purchaser to use his or her credit card, debit card, electronic check, or financial account as a  
10 payment vehicle, electronically schedules pick-up and delivery of the purchased merchandise,  
11 virtually escrowing the seller's goods during the transaction, escrows the purchaser's money  
12 during the fulfillment and inspection period, and electronically distributes funds to the entitled  
13 parties after the purchaser has received, inspected and accepted the merchandise.

14 In one embodiment of this invention, a web-based purchasing method using a networked  
15 computer system to facilitate the purchase of merchandise by a purchaser from a seller is  
16 established. Preferably, the seller and the purchaser each have an associated financial account  
17 such as a credit card, check card, electronic check with bank routing and checking account  
18 numbers, and/or other financial accounts to facilitate the purchase of merchandise using the  
19 invention. The networked computer system includes a merchandise database having stored  
20 therein a product profile table for the merchandise. The networked computer system may  
21 receive a purchase offer initiated from the purchaser to the seller for merchandise offered for sale  
22 by the seller at an established purchase price. Also, the networked computer system may receive  
23 an offer to sell initiated from the seller to the purchaser for merchandise wanted for purchase by  
24 the purchaser. The offer to sell may or may not include a sales price desired by the seller.  
25 Additionally, the purchaser may initiate a purchase offer without stipulating a purchase price.  
26 The established purchase price may have been previously negotiated between the parties by  
27 using the networked computer system for offer/counter offer, or it may have been predetermined  
28 in advance by the seller and accepted by the purchaser. The purchase offer can be associated  
29 with the purchaser's financial account and the purchaser's registered delivery address. The  
30 networked computer system recognizes acceptance of the offer/counter offer, by the seller or the  
31 purchaser, and a transaction identification number (TID) may be created, thus establishing an

1 associated purchase and transaction account between the seller and the purchaser. A request for  
2 authorization for credit against the purchaser's financial account is generated and transmitted to  
3 a financial institution associated with the purchaser's financial account to verify that the  
4 purchaser has the gross purchase price in the purchaser's financial account to make the purchase.  
5 The gross purchase price generally includes the purchase price established between the seller and  
6 the purchaser, as well as all appropriate transaction fees. The financial institution then generates  
7 an authorization indicator in response to the request for authorization, which is then reviewed by  
8 the system to verify that the purchaser is authorized to make the purchase using the purchaser's  
9 financial account. At this point, the purchaser's funds or credit may be reserved. The seller may  
10 be notified by the system that an authorized purchaser desires to purchase the merchandise  
11 offered for sale; alternatively, the seller may be notified by the system of an unauthorized  
12 purchase offer (i.e. prior to the system requesting an authorization for credit). The seller may be  
13 specifically requested to acknowledge the purchase offer by the purchaser, to confirm that the  
14 merchandise is still available for purchase, to accept the purchase offer and to establish the date  
15 the merchandise may be ready for shipment. The system may generate a query to the seller prior  
16 to the established shipment date requesting confirmation that the merchandise is packaged and  
17 ready for pick-up and delivery. The system then transmits a request to the delivery system which  
18 automatically contacts a carrier associated with the delivery system to pick up the merchandise  
19 from the pick-up address specified by the seller. The carrier then picks up the merchandise, as  
20 confirmed by the carrier to the delivery system, and an amount equal to the established gross  
21 purchase price is transferred from the purchaser's financial account into an escrow account.  
22 After the merchandise is delivered to the address specified by the purchaser, as confirmed by the  
23 carrier to the delivery system, at least a portion of the established purchase price is transferred  
24 from the escrow account to the seller's associated financial account, as well as to other  
25 participants of the web-based purchasing system. This transfer from the escrow account may be  
26 delayed for a predetermined amount of time pending the purchaser's acceptance of the  
27 merchandise.

28 The foregoing and other objects are intended to be illustrative of the invention and are  
29 not meant in a limiting sense. Many possible embodiments of the invention may be made and  
30 will be readily evident upon a study of the following specification and accompanying drawings  
31 comprising a part thereof. Various features and subcombinations of the invention may be

employed without reference to other features and subcombinations. For instance, a person may deliver a package utilizing the delivery system of the present invention without using the escrow services. The delivery system of the present invention allows users to pay for shipping using noncash methods such as checks and credit cards, and allows users to arrange for packages to be picked up from any location. The current invention overcomes the deficiencies of previous delivery systems which required either cash payment, or transportation of packages to a third party facilitator's location.

### **Brief Description of the Drawings**

These and other features, aspects, and advantages of the present invention will become better understood with regard to the following description, appended claims, and accompanying drawings wherein:

Figure 1 is a schematic block diagram of a networked computer system to facilitate the purchase, pick-up and delivery of, escrow, as well as payment for merchandise in accordance with one embodiment of the present invention; and

Figures 2 through 5 are flow charts showing the functions of a method to facilitate web-based purchase of merchandise using a networked computer system as shown in Figure 1.

Figure 6 is a flow chart showing the options for a person using the system of the present invention to access the delivery system of Figure 1.

Figure 7 is a flow chart showing the user registration process shown of Figure 6.

Figure 8 is a flow chart showing the user logon process shown of Figure 6.

Figure 9 is a flow chart detailing the user menu shown of Figure 6.

Figure 10 is a flow chart showing the shipping detail process of Figure 9.

Figure 11 is a flow chart showing the payment detail process of Figure 9.

Figures 12 through 14 are flow charts showing of the display transaction process of Figure 9.

These drawings are provided for illustrative purposes only and should not be used to unduly limit the scope of the present invention.

### **Detailed Description of the Invention**

The present invention transforms the online buying process by linking and automating every stage of the transaction including: (i) purchase offer, negotiation, and offer acceptance; (ii) credit verification and billing authorization; (iii) verification of product manufacture and shipping status; (iv) order fulfillment (i.e., pick-up and delivery) virtually escrowing the merchandise; (v) credit settlement and purchase funds escrow; and (vi) escrow settlement and merchant payment. Referring now to Figure 1, therein is shown one preferred web-based purchasing system **100** to facilitate the purchase of merchandise by a purchaser from a seller. The system **100** includes, and is controlled by, a transaction computer **110** that is connected to a publicly available network, such as the Internet global computer network.

The transaction computer **110** controls the overall operation of the web-based purchasing system **100** of the present invention. For example, the transaction computer **110** may provide a website **170** organized in a variety of ways providing functions such as enabling users to become registered sellers and/or purchasers, allowing sellers to advertise their products, allowing potential purchasers to review and select merchandise, allowing the users to negotiate a transaction, and allowing the users to complete a transaction, including the functions of payment and delivery. The website **170** may allow participants of the web-based purchasing system **100** to communicate and interact with the system **100** and other participants. The website **170** may be linked to other websites, allowing users who have negotiated a transaction and agreed upon a purchase price and possible other conditions using other means, such as an auction website, to complete their transaction using the system of the present invention. These other websites may be termed net venue transaction participants. The website **170** may include other functions, such as allowing the merchandise available for purchase through the system to be advertised and accessed in a variety of ways, such as through a conventionally-implemented search engine.

In addition to the traditional computer components, such as a processor, random access memory (RAM), read only memory (ROM), an operating system, and various communication devices and ports, the transaction computer **110** incorporates a number of databases. For example, the transaction computer **110** may have a merchandise database **112**, which stores information related to a plurality of products offered for sale through the web-based purchasing system **100**. This information may be arranged into product profiles and includes, for example, the product identity; the seller's identifying information, and the established purchase price for

1 the product. The product profile may also include various types of other product information,  
2 i.e., further details on the product and its availability. The product profiles may include digital  
3 advertisements in a variety of multimedia formats, including audio, photographs, video, and text.  
4 Additionally, the advertisement may direct the potential purchaser to the seller's own website by,  
5 for example, a hypertext link. The product profiles stored in the merchandise database 112 may  
6 be generated from information obtained from the seller, or may be linked to databases from other  
7 websites. Thus, a net venue transaction participant may host its own website containing a  
8 database of product profiles that may be accessed via the purchasing system 100. The  
9 transaction computer 110 organizes and uses the information stored in the merchandise database  
10 112 to create the website 170 that digitally advertises and/or provides information about the  
11 products for sale.

12 The transaction computer 110 preferably also includes a registered user database 114,  
13 which maintains a list of registered buyers and purchasers as well as information required of the  
14 users to allow them to access and use the features of the web-based purchasing system 100.  
15 Each record of the registered user database 114 may include information relating to the user,  
16 such as name, e-mail address, delivery and/or pick-up address, telephone number, and financial  
17 account information. Financial account information for registered purchasers includes a viable  
18 and approved credit card or checking account information. Sellers must generally provide a  
19 checking account routing and account number to allow direct electronic deposit of funds upon  
20 the completion of a transaction. This information is obtained when a seller or purchaser first  
21 registers to use the web-based purchasing system 100 using, for example, website 170, and may  
22 preferably be updated or revised anytime a seller or purchaser connects to the system 100. The  
23 transaction computer 110 may assign an account number and/or a password to each registered  
24 user. The use of a password ensures that only the registered user, or someone under his or her  
25 control, has access to view and/or modify information relating to his or her account or any  
26 transaction that he or she may be participating in through the system.

27 The transaction computer 110 also houses a settlement database 118, which stores  
28 information related to the communications between the transaction computer 110 and a  
29 transaction settlement network 150 as described below. The settlement database 118 also  
30 controls the automated re-authorization process as described below. The transaction computer  
31 110 also preferably includes a transaction database 116, which tracks all transactions performed

1 through the system 110 with fields such as delivery status, pick-up status, buyer acceptance of  
2 transaction, seller acceptance of transaction, ship date, package delivery, etc. The transaction  
3 database 116 thus stores information relating to "active" transactions, i.e., those transactions that  
4 are not yet complete, to enable the system 100 to appropriately monitor and process such on-  
5 going transactions. Additionally, the transaction database 116 stores information related to  
6 completed transactions, to enable the operators of the system 100 to review any past transactions  
7 in response to, for example, user complaints. As those skilled in the art will appreciate, portions  
8 of the transaction database 116, particularly the portion related to completed transactions, may  
9 be archived and removed from the memory of the transaction computer 110 and stored on other  
10 conventional off-line memory devices, such as tape drive or mass storage disks.

11 The transaction computer 110 also includes an escrow account 120, which temporarily  
12 holds the purchaser's funds pending approval of the merchandise by the purchaser. The escrow  
13 account 120 is controlled by the transaction computer 110 based on information contained in the  
14 transaction database 116. The escrow account may be organized by all parties involved in the  
15 purchasing system 100.

16 The transaction computer 110 is connected to a publicly available network, such as the  
17 Internet, by an Internet Service Provider through a conventional telephone network, or through  
18 commercial on-line services, such as America OnLine, Yahoo!, or Uunet, allowing purchasers  
19 and sellers a wide range of connection alternatives through which users may access the system of  
20 the present invention. Typically, a buyer or seller may access the system by, for example, a  
21 purchaser computer 130 and/or a seller computer 140. Although Figure 1 shows only one  
22 purchaser computer 130 and a single seller computer 140, the system 100 is understood to  
23 extend to include multiple buyers and sellers, each having their own computers to network to,  
24 and communicate with, the transaction computer 110. In another embodiment, multiple users  
25 (sellers and purchasers) can access the system 100 through a third party's computer system,  
26 which may be located at, for example, an auction site, a traditional brick and mortar retail store,  
27 at a collectibles show, or another's residence. Thus, a user of the system 100 need not even own  
28 a personal computer to take advantages of the benefits of the present invention. Also, a seller or  
29 a purchaser may be an individual, a group of people, a company, or an institution.

30 A delivery system 160 is also connected through the network to the transaction computer  
31 110. The delivery system 160 includes a carrier capable of picking up and delivering

merchandise, such as United Parcel Service, Federal Express Corp., the United States Postal Service, or bulk item transportation providers, such as Mark VII. The delivery system **160** also preferably includes a computer system incorporating conventional tracking capabilities to allow the transaction computer **110** to monitor the status of packages picked up and delivered in connection with the system **100**, which may be accessed directly by the purchaser and seller to review the delivery status. The delivery system **160** communicates with the transaction computer **110** via the network to schedule pick-ups and delivery of merchandise and to provide the status of such deliveries. The timely communication between the delivery system **160** and the transaction computer **110** ensures that the escrowing of both the purchaser's money and the seller's merchandise is achieved.

The transaction computer **110** is also networked to certain financial services, such as a transaction settlement network **150**. The transaction settlement network **150** represents presently-available commercial institutions that process credit and other financial transactions. For example, the transaction settlement network **150** may represent commercially available credit card processing institutions (e.g., VISA, Master Card, Discover, etc.). The transaction settlement network **150** also includes banks or other institutions that provide merchant accounts for entities that want to receive payment for the sale of goods or services. In this invention, the operators of the system **100** act as a merchant, thus allowing sellers to sell their merchandise to purchasers without having to qualify as credit card merchants. Thus, the operators of the system **100** have a merchant account that is similar or identical to the conventional merchant accounts that are provided to businesses. The transaction computer **110** interfaces with the transaction settlement network **150** to collect and distribute payments to the various parties involved in the system, including purchasers, sellers, delivery systems, escrow services, banks, billboards, and referral sources. For example, a purchaser's transactions that are initiated using the system **100** would show up on the purchaser's credit card statements as a charge from operators of the web-based purchasing system **100**. Processing of credit card transactions by the transaction computer **110** through the transaction settlement network **150** may be supported by various commercially available software packages, such as WebCash Manager by Pulitzer & Haney or WebAuthorize by Tellan.

In one embodiment of the present invention, the transaction computer **110** operates as a web server, both receiving and transmitting e-mail messages related to merchandise available for

1 purchase through the system and on active transactions processed by the system. The transaction  
2 computer 110 thus must be capable of high volume transaction processing, performing a  
3 significant number of mathematical calculations, processing communications as rapidly as  
4 possible, and performing database searches. A processor such as a Pentium 686 may be used as  
5 the transaction computer 110, or any equivalent processor or multiple processors networked  
6 together. The transaction computer 110 includes software capable of performing all system  
7 operations as described below in further detail. Also, while the embodiment described herein  
8 describes a single computer performing the functions attributed to the transaction computer 110,  
9 those skilled in the art will appreciate that such functions may be distributed across a larger  
10 number of computers, including those connected across a network.

11 Generally, users of the presently preferred web-based purchasing system communicate  
12 with the system using e-mail messages. Certain information may also be posted or accessible  
13 through website 170. Alternatively, purchasers and sellers may access the transaction computer  
14 110, albeit in certain instances with human involvement, telephone, voice-mail, facsimile, or  
15 postal mail transmissions.

16 Figures 2 through 5 are schematic flow charts showing the functions of a method to  
17 facilitate the purchase of merchandise using a web-based purchasing system as shown in Figure  
18 1, in accordance with one embodiment of the present invention. Except for the interaction  
19 between the system and the purchaser and seller, the entire process of the present invention may  
20 be fully automated.

21 The networked transaction computer 110 waits until a user connects to and logs on the  
22 system (function 202), and selects the type of transaction to process. A user generally connects  
23 to the system by accessing website 170 coupled to and controlled by the transaction computer  
24 110. However, participants may use the system via another's website via a hyperlink to connect  
25 to the system through a dedicated home page or by reference from any licensed net venue  
26 transaction participant permitted to connect to the website 170. A net venue transaction  
27 participant is one who participates in the web-based purchasing system by providing an entry  
28 point into the system. Thus, a net venue transaction participant may host its own website  
29 containing a database of product profiles that may be accessed via the purchasing system 100.  
30 Typically, a net venue transaction participant provides a means for its customers to negotiate a  
31 transaction, but does not offer services to allow its customers to complete the transaction. For

1 example, the net venue transaction participant may be an auction website that allows its  
2 customers to "negotiate" or otherwise arrive at an agreed upon price for the merchandise. Upon  
3 completion of the auction process, the auction website may then suggest to its customers that  
4 they connect to the present web-based purchasing system 100 to complete the transaction, i.e., to  
5 arrange for pick-up and delivery of and payment for the merchandise. Because the net venue's  
6 customers "complete" their transactions separate from the net venue's website (e.g., pick-up and  
7 delivery of, and payment for merchandise purchased), the net venue participant is left to collect  
8 its own receivables by conventional means (e.g., billing the merchant/debtor and then receiving  
9 payment by mail or phone.) However, the present invention enables net venue participants to  
10 collect and receive payment for their receivables at the same time their customers complete their  
11 transactions using the web-based purchasing system 100.

12 In order to use the web-based purchasing system 100 for transactions, the purchaser and  
13 the seller both need to have registered as users of the system 100. As registered users, such  
14 purchasers and sellers of the system 100 may conduct commercial transactions with each other,  
15 such as selling products using the features of the present invention. The user may logon to the  
16 system via an electronic network, with the transaction computer 110 acting as a web server. For  
17 example, a person may initially register as a new seller by providing the transaction computer  
18 with the seller's registration information or modify the registered seller's existing information  
19 (function 204). This seller's information may include, for example, the seller's name, e-mail  
20 address, pick-up address, telephone number, and financial account information. Another person  
21 may elect to register as a new purchaser or modify the registered purchaser's information  
22 (function 206). A new seller or pre-registered seller may choose to add or modify merchandise  
23 to the merchandise database (function 208). Similarly, a purchaser may advertise that he/she  
24 desires to purchase certain merchandise at an established offer price. Each of these actions  
25 results in the system updating the appropriate registered user and/or merchandise databases to  
26 reflect the new or modified information. Additionally, the transaction computer 110 may assign  
27 a password and/or account number to each new registered user. While the preferred method for  
28 a user to register with the web-based purchasing system 100 would be to access the system's  
29 website, alternative forms of registration may be used, including e-mail, facsimile transmission,  
30 postal mail, etc.

1 In addition to establishing an account with the web-based purchasing system, a purchaser  
2 may elect to issue a purchase offer for particular selected merchandise (function 210) at an  
3 established purchase price. The purchase price may be established as an advertised price as  
4 shown in the on-line advertisement for the merchandise, or may be a negotiated price, negotiated  
5 through the present invention or off-line methods, such as face-to-face negotiation, auction  
6 (including web-based auction sites), newspapers, telephonic or written communications, or other  
7 advertising mediums. The established purchase price may also be defined as a counteroffer  
8 issued by the purchaser to a seller's advertised price, or a counter offer issued by the seller in  
9 response to a purchaser's counteroffer. The purchaser may identify the particular merchandise  
10 by searching through the products available for sale in the merchandise database 112 using, for  
11 example, a search engine located in the transaction computer 110 and accessed by the purchaser  
12 computer 130. Importantly, a purchaser and a seller may meet and negotiate a sale  
13 independently of the system 100 and then use the system 100 to complete the transaction by  
14 simply logging onto the system and using its features to arrange for pick-up and delivery of, and  
15 payment for the sold merchandise.

16 After the purchaser logs-on with the system (function 202), and then selects the  
17 merchandise offered for sale (function 212), the system requests the purchaser's preferred  
18 payment method and delivery address (function 214). The system then requests the purchaser to  
19 validate his or her preferred payment method (function 216). If the purchaser desires to alter  
20 either the payment method or the delivery address for this particular transaction, the purchaser  
21 then provides the system with his or her financial account information and/or delivery address  
22 (function 218). Payment methods may include conventional credit cards, personal checks,  
23 electronic funds transfer, digital money, E-cash, etc. Using the purchaser's selected or provided  
24 financial account information, the system then requests authorization for credit approval for an  
25 amount equal to at least the established purchase price, plus possibly an additional estimated  
26 amount to cover delivery and transaction fees, from the transaction settlement network (function  
27 220). The delivery and transaction fees can be paid entirely by the purchaser, paid entirely by  
28 the seller, or paid partially by the purchaser and partially by the seller. The transaction fees may  
29 include payments to net venue participants, other referral sources, fees for escrow services, fees  
30 for the operator of the web-based purchasing system 100, and applicable taxes. If the transaction  
31 settlement network 150 indicates that the purchaser has sufficient funds or credit available to

1 purchase the selected merchandise (function 222), the system then reserves the funds (function  
2 224) and control is then transferred to function 226. This function serves to "lock-up" a portion  
3 of the available credit on the purchaser's credit card or other payment vehicle while the  
4 transaction is "active." At function 222, the transaction settlement network responds to the pre-  
5 authorization request, indicating whether sufficient credit is available. When the purchaser  
6 selects merchandise the transaction settlement network 150 will provide a Transaction  
7 Identification number (TID), which the transaction computer 110 stores in its transaction  
8 database 116 along with other information related to this "active" transaction, for later reference.  
9 The other information stored in the transaction database 116 may include the product selected,  
10 the seller, the buyer, and the stage of the transaction. If the transaction settlement network 150  
11 responds that the purchaser has insufficient funds or credit available, the system terminates the  
12 authorization request and so notifies the purchaser (function 225). At this point, the purchaser  
13 may supply another financial account to make the purchase or terminate the transaction  
14 completely. If the purchaser supplies another financial account, the system repeats starting at  
15 function 220.

16 If the purchaser has sufficient funds or credit, the system then notifies the seller and  
17 provides the seller with a purchase offer specifying the transaction details, such as the selected  
18 merchandise and the purchase amount (function 226). This notification is preferably by way of  
19 an e-mail message delivered by the system. Upon receipt of the notification, and after reviewing  
20 the transaction details (which may be provided in the e-mail message or through website 170),  
21 the seller can then either (function 230): (i) accept the purchase offer; (ii) reject the purchase  
22 offer and terminate the transaction process (function 228); or (iii) reject the purchase offer and  
23 attempt to re-negotiate the offer by supplying the purchaser with a counteroffer (function 234).  
24 If the seller elects to attempt to re-negotiate the offer, the seller provides a counteroffer to the  
25 purchaser for consideration (function 232), through the web-based purchasing system, which is  
26 tracked by the system in the transaction database 116. The purchaser can then terminate the  
27 transaction or initiate another purchase order, using the seller's offered price, or another offer  
28 from the purchaser (function 234). The process then repeats starting at function 226. The  
29 system may also include a provision that, in the event that the purchaser or seller does not  
30 respond to a purchase offer or a counteroffer within a predetermined period of time, the system  
31 will terminate the active transaction. Additionally, if the authorization to charge the purchaser's

1 credit card account is about to expire, the system can automatically suspend the transaction until  
2 the purchaser's credit is re-authorized by repeating functions 220 through 224.

3         Once the seller has accepted the purchaser's offer, or the purchaser has accepted the  
4 seller's counteroffer, the seller then provides pick-up instructions, such as, for example, the pick-  
5 up address, the estimated pick-up date, the number of packages, and the approximate weight of  
6 the packages (function 233). Certain of this information may be retrieved from the registered  
7 user database 114 and/or the merchandise database 112. This information is then transferred to  
8 the delivery system 160 (function 236), which awaits further instruction from the seller as to  
9 when the packages are available for pick-up. Once the package(s) is available for pick-up  
10 (function 238), which may be delayed pending product manufacture by the seller, the seller  
11 notifies the delivery system 160 through the system. Again, the system can incorporate a  
12 number of checks and balances to ensure that all pending transactions are completed within a  
13 given period of time. As another example, the system could notify the seller if he or she has not  
14 notified the delivery system that the package is available for pick-up within a predetermined  
15 amount of time.

16         The delivery system 160 is then provided the transaction information (TID) and is  
17 automatically dispatched to pick up the packages (function 240). The information on the  
18 transaction sent to the delivery system 160 is preferably sufficient to allow the delivery system to  
19 print out a delivery label, which the carrier can then carry out to the seller's address and readily  
20 attach on the package(s). An e-mail message may be sent from the delivery system (possibly  
21 through the transaction computer) to the seller to remind him or her of the pick-up date and to  
22 request more specific information regarding the merchandise (e.g., number and weight of  
23 packages) (function 242). The delivery system may not actually dispatch a carrier to the seller's  
24 address unless the seller acknowledges this confirmation. Upon confirmation that the packages  
25 have been picked up from the seller, the monies previously reserved against the purchaser's  
26 financial account are transferred into the system escrow account 120 (function 244). Thus, the  
27 escrow account allows payment to the seller to be delayed until the delivery of the merchandise  
28 to the purchaser is confirmed and until the purchaser has had a sufficient amount of time to  
29 inspect the merchandise, while, at the same time, ensuring that the purchaser will in fact make  
30 payment. Thus, during this period of time, both the money and the merchandise are escrowed by  
31 the system. Another e-mail message may then be sent to both the purchaser and seller to notify

1 them of the progress of the transaction (function 246). The merchandise is then delivered to the  
2 purchaser's specified delivery address (function 248).

3 The purchaser's funds are held in the escrow account until the purchaser has an  
4 opportunity to inspect the purchased merchandise. After delivery of the merchandise is  
5 electronically verified by the delivery system and the buyer has inspected and accepted them, or  
6 has failed to reject the merchandise within a predetermined amount of time, the escrowed funds  
7 are released to the entitled parties using, for example, automated NACHA electronic fund  
8 transfer files through the transaction settlement network 150 (functions 250 through 256). The  
9 interested parties receiving payment may include, in addition to the seller, the operator of the  
10 web-based purchasing system 100, the escrow service, the transaction settlement network 150,  
11 and the delivery system 160. An additional payment may be made to a third party net revenue  
12 transaction participant, such as an auction site, from which the parties initiated their transaction,  
13 and/or other referral sources. Details of the transaction may be recorded in the transaction  
14 database 116 (function 258).

15 The present invention also provides for automated resolution of disputes. For example,  
16 in the event the purchaser desires to reject the merchandise (function 250), the purchaser  
17 contacts the web-based purchasing system (function 260) and provides a reason for the rejection,  
18 which may include a defective or broken product, that the product is not as advertised, or that the  
19 purchaser simply no longer desires the product. The web-based purchasing system may then  
20 notify the delivery system to pick-up the merchandise from the purchaser and return it to the  
21 seller (function 262) and release the escrowed money back to the purchaser's account, minus any  
22 appropriate transaction fees (function 264). While those skilled in the art may establish many  
23 different approaches for handling each of the various types of rejections, set forth below is one  
24 set of approaches.

25 In the event the purchaser rejects the merchandise because it is defective, the purchaser  
26 notifies the web-based purchasing system, which then automatically contacts the delivery system  
27 160, and the carrier associated with the delivery system is notified to return to the purchaser to  
28 pick-up the defective merchandise and return it to the seller. The system will send the seller a  
29 message via e-mail notifying him or her to expect return of the merchandise. If the seller can  
30 repair or replace the defective merchandise, the purchaser can notify the system and arrange for  
31 re-delivery. Generally, the seller will incur the charges for this extra shipping charge.

1 In the event the purchaser rejects the merchandise because he or she simply no longer  
2 desires the merchandise, the purchaser notifies the web-based purchasing system, which then  
3 automatically contacts the delivery system **160**, and the carrier associated with the delivery  
4 system is notified to return to the purchaser to pick-up the merchandise and return it to the seller.  
5 Upon verified return of the package(s) to the seller, the purchaser's funds are returned via the  
6 transaction settlement network **150**, possibly after subtracting any appropriate shipping charges  
7 and appropriate transaction fees.

8 In the event the purchaser rejects the merchandise because it is broken or damaged, the  
9 purchaser notifies the web-based purchasing system, which then automatically contacts the  
10 delivery system **160** for resolution, and the carrier associated with the delivery  
11 system is notified to return to the purchaser to pick-up the merchandise for inspection. If the  
12 delivery system, and/or carrier, is determined to be at fault, the escrowed funds will be held  
13 pending resolution by the delivery system with the purchaser and seller. Upon resolution, the  
14 escrowed funds will be released to the appropriate parties. In the event the carrier associated  
15 with the delivery system is determined not at fault, the merchandise is returned to the seller for  
16 resolution in a manner as a defective product.

17 In the event the purchaser rejects the merchandise because it is not as advertised or  
18 represented, the purchaser notifies the web-based purchasing system and the carrier associated  
19 with the delivery system is notified to pick up the merchandise and return it to a location  
20 associated with the operator of the system **100** for resolution. Such resolution may, in  
21 appropriate circumstances, involve contacting authorities if it is determined that commercial  
22 fraud may be involved.

23 The present invention also incorporates a means to keep the authorization issued by the  
24 transaction settlement network **150** "live" during the pendency of an active transaction. As is  
25 known, most credit card issuers automatically drop an authorization if the authorization has not  
26 been settled within a certain period of time (e.g., between 7 and 31 days). The present invention  
27 includes the ability to re-time a credit card or electronic funds authorization that allows the  
28 original credit authorization issued by the settlement transaction network **150** to retain its  
29 original authorization number and amount authorized until the authorization is settled, or until a  
30 specific predetermined fulfillment date has passed. The re-timing of the authorization must  
31 occur before the drop date of the authorization, which varies for each credit issuer. The system's

1 transaction computer **110** references the purchaser's original credit authorization and  
2 authorization date for each transaction. The transaction computer **110** then communicates with  
3 the settlement network **150** providing the settlement network's computer with a specific re-  
4 authorization period of time (e.g., between 3 days and 7 days) which then automatically, and  
5 continuously, "re-times" the original credit authorization until a specific predetermined  
6 fulfillment date has passed.

7 Additionally, the purchasing system **100** of the present invention can include a means to  
8 cancel a credit authorization prior to the credit issuer's drop date, enabling the system to free up  
9 the purchaser's credit account in the event a transaction is canceled. Such a feature is useful if  
10 the product offered for sale is no longer in the seller's inventory. This function generally  
11 involves the seller notifying the web-based purchasing system **100** that the merchandise offered  
12 for sale is not longer in inventory, or the purchaser's offer to purchase merchandise is ignored by  
13 the seller and a predetermined "offer acknowledgment" date (e.g., between 1 and 5 days) has  
14 passed. The transaction computer **110** then communicates with the settlement network **150**  
15 providing the settlement network's computer with a specific re-authorization period of time of  
16 "0" days. The settlement network **150** then automatically drops the purchaser's original credit  
17 authorization.

18 While Figures 2 through 5 show one embodiment of the present invention, those skilled  
19 in the art will readily recognize that many variations exist and fall within the spirit and scope of  
20 the present invention. For example, a seller may, when adding a particular product to the  
21 merchandise database **112**, establish that he or she will automatically accept any purchase offer  
22 above a given strike price. This will eliminate the function of having the seller "accept" the  
23 purchaser's purchase offer and further streamline the process. The seller may also indicate a  
24 quantity of products that are available, which can be stored in the appropriate product profile of  
25 the merchandise database. The transaction computer **110** may then keep track of how many  
26 products are sold and delivered and continue to advertise such product until all are sold. Thus,  
27 using these two features, a seller could connect to the web-based purchasing system **110** once,  
28 add a product to the merchandise database **112**, and then "sell" all such products while having  
29 the system ensure delivery and acceptance of all such products without further involvement from  
30 the seller. A seller's indication that any or all products have indeed sold, may be as simple as a  
31 noticeable increase in the seller's deposit account.

1 As previously indicated, the web-based purchasing system **100** of the present invention  
2 may be implemented through a web server and the various sellers and purchasers may access the  
3 system **100** by logging onto the web server, for example, through the World Wide Web portion  
4 of the Internet. The present invention thus includes a system to fully automate the entire  
5 commercial transaction process using a network computer system such as the Internet. The  
6 system and method preferably includes the escrowing of both funds and merchandise until the  
7 parties are satisfied with the transaction, automated dispatch of third party shippers, electronic  
8 confirmation of order pick-up and delivery, and built-in fraud protection. The system allows  
9 individuals and small businesses around the world to conveniently become importers and  
10 exporters of goods at a relatively low cost. The present invention may be implemented through  
11 a website that allows small businesses, merchants for antiques and collectibles, memorabilia  
12 enthusiasts, home crafters, sporting and entertainment season ticket holders, family households,  
13 and the like, to advertise their goods for sale, or the goods they desire to purchase, free of  
14 charge, until the sale is consummated.

15 Figure 6 shows an embodiment of the system **100** in which a user accesses only the  
16 delivery system **160** without utilizing the negotiation and/or payment aspects of the system **100**.  
17 Figure 6 is a flow chart depicting the various options for a person using the system **100** to access  
18 the delivery system **160** of Figure 1 to arrange for delivery of a package. The user can be the  
19 person possessing the package prior to pickup, the person to which final delivery is intended, or  
20 a separate third party. In function **602** a user connects to the system **100** by accessing website  
21 **170** and function **604** displays a default menu. The user may access the web site **170** via  
22 another's website, via a hyperlink or by reference from a net venue transaction participant. The  
23 default menu of function **604** gives the user various options such as: registering for the site  
24 (function **606**), logging on (function **610**), reading privacy information (function **616**), reading  
25 frequently asked questions (FAQ) (function **622**), reading information about the website  
26 (function **626**), and reading the user agreement for the site (function **630**). If the user decides to  
27 register (function **606**), a registration process is initiated (function **608**) (see Figure 7 for  
28 registration process), after which a delivery user menu (function **614**) is accessed (see Figure 9).  
29 If the user is already registered, the user may initiate (function **610**) a logon process (function  
30 **612**) (see Figure 8) to the system **100**. Once the logon is complete the delivery user menu  
31 (function **614**) is displayed (see Figure 9). If the user selects the privacy option (function **616**),

1 the privacy page is displayed (function 618), and the default menu is retained (function 620). If  
2 the user chooses to read the FAQ (function 622), the FAQ page is displayed (function 624), and  
3 the default menu is retained (function 620). If the user selects About the website (function 626),  
4 the About the website page is displayed (function 628), and the default menu is retained  
5 (function 620). If the user selects the user agreement (function 630), the user agreement page is  
6 displayed (function 632), and the default menu is retained (function 620). If the user does not  
7 select any action, function 634 times out the session.

8 Figure 7 shows the user registration process (function 608) shown in Figure 6. Function  
9 702 begins the registration process. The new user is prompted to enter a user I.D. and a  
10 password for the site (function 704). If the new user I.D. is not unique, the system prompts the  
11 user to enter a different user I.D. (function 706). Once the user has entered a unique user I.D.,  
12 the system determines whether or not the password is valid. If the password is not valid, the  
13 system will prompt the user to enter a new password (function 708). Once a valid password is  
14 acquired, the user is prompted to enter basic registration information such as address, phone  
15 number, billing information, etc. (function 710). The user is then logged into (function 712) the  
16 system 100, and the delivery user menu is displayed (function 714, 614).

17 Figure 8 shows the user logon process (function 612) shown in Figure 6. The user  
18 requests to logon (function 802) to the system 100, and a logon page is displayed (function 804).  
19 The user is prompted to enter his/her user I.D. and password (function 806). The system  
20 determines whether or not the user I.D. is valid (function 808). If the user I.D. is valid, the  
21 system determines whether or not the password is valid (function 810). If the user I.D. and  
22 password are valid, the delivery user menu is displayed (function 814, 614). If either the user  
23 I.D. or the password is invalid, the logon is failed (function 812) and the user is prompted to  
24 attempt to logon again (function 816). If the user decides to attempt to logon again, the logon  
25 page is displayed (function 804), and the functions already described repeat from that point. If  
26 the user decides not to attempt logon again, the user is prompted to register (function 818). If  
27 the user decides not to register, the user exits the system 100 (function 820). If the user decides  
28 to register, function 822 sends the user to function the user registration (function 702) (see  
29 Figure 7).

Figure 9 shows the delivery user menu shown (function 614) in Figure 6. Function 902 displays the delivery user menu. The delivery user menu allows the user to edit registration information (function 904). If the user selects to edit registration information, the system sends the user to a registration edit function (function 906). The delivery user menu allows the user to begin a transaction (function 908); alternatively (not shown), a user may choose to cancel an existing transaction, initiate a trace of a shipment, or file a claim for damaged or missing items. If the user begins a transaction, the user is prompted to enter shipping details (function 910) (see Figure 10). After entering shipping details, the user is prompted to enter payment details (function 912) (see Figure 11). The delivery menu also allows a user to monitor existing transactions (function 914). If the user chooses to monitor the status of an existing transaction, a transaction list is displayed (function 916) (see Figure 12). The delivery menu allows the user to log out (function 918) of the system 100. While the user is logged on, the system will wait a predetermined amount of time for a user action (function 420). If there is no user action the system times out the session (function 922). If the session times out, or if the user logs out, the system ends the session and returns the user to the delivery homepage (function 924) displaying the Default Menu (function 604) (see Figure 6).

Figure 10 shows the shipping detail process (function 910) of Figure 9. The system 100 displays the shipping details page (function 1002). The user enters a pick-up address (function 1004) and the system 100 filters out carrier options based on the pick-up address (function 1006). The user then enters the delivery address (function 1008) and the system 100 filters out carrier options based on the pick-up and delivery addresses (function 1010). The user then selects a pick-up date (function 1012) and the system 100 filters out carrier options based on the pick-up address, delivery address, and pick-up date (function 1014). The user can select a delivery date (function 1016) and the system 100 filters out carrier options based on the pick-up address, delivery address, pick-up date, and delivery date (function 1018). The pick-up and delivery dates can designate an earliest available date, a latest possible date, or a date range for pick-up/delivery by the carrier. The user can select a price limit (function 1020) and the system 100 filters out carrier options by pick-up and delivery addresses, pick-up and delivery dates, and price limit (function 1022). The user can enter package details (i.e. weight, description, type of contents of each package, etc.) (function 1024) and the system 100 filters out carrier options

1 based on pick-up and delivery addresses, pick-up and delivery dates, price limit, and package  
2 details (function 1026). The system 100 allows the user to cancel the shipping transaction, or to  
3 select a carrier from the filtered carrier options (function 1028). If the user has selected a carrier,  
4 the system requests the user to enter payment details (function 1030) (see Figure 11). If the user  
5 does not select a carrier within a predetermined time or chooses to cancel the transaction, the  
6 system 100 will return the user to the user menu of Figure 9 (function 1032).

7 Figure 11 shows the payment detail process (function 912) of Figure 9. The system 100  
8 allows the user to specify funding source information (i.e. amount, type, and source of funding)  
9 (function 1102). The system 100 then determines whether the funding source information is  
10 complete (function 1104). If the funding source information is incomplete the system 100  
11 allows the user to re-enter the funding source information (function 1106), and the system 100  
12 again determines whether the funding source information is complete (function 1104). Once the  
13 funding source information is complete, the system 100 determines whether funds can be  
14 validated (function 1108) by the funding source. If the funds cannot be validated, the system  
15 100 indicates that funds could not be verified with the current source (function 1110) and the  
16 system 100 then determines whether or not there is another funding source available (function  
17 1112). If another funding source exists, the system 100 retrieves information about the  
18 alternative funding source (function 1114) and requests the user to enter any additional funding  
19 source information (function 1106). If an alternative funding source is unavailable, the system  
20 100 determines that funds could not be validated (function 1122), fails the transaction (function  
21 1126) and displays the delivery user menu (function 1128) (see Figure 9). If the system 100 can  
22 validate funding (see function 1108) the system then creates a final total itemization of charges  
23 (function 1116). The system then requests the user to either accept or decline the total (function  
24 1118). If the user accepts the total, the system 100 displays a confirmation screen (function  
25 1120), and determines whether the validation of funds remains viable (validation may become  
26 inactive if a predetermined time period has elapsed) (function 1122). If the validation is viable,  
27 the system completes the transaction/shipping request (function 1124) and returns the user to the  
28 delivery user menu (function 1128) (see Figure 9). If the system 100 cannot validate funding  
29 (i.e. the user does not accept the total charges, the original validation is no longer viable, or

validation was never achieved), the system 100 will fail the transaction (function 1126) and display the delivery user menu (function 1128).

Figures 12 through 14 show the display transaction process (function 1202, 916) of Figure 9. If the user selects to display the transaction list the system 100 determines whether the user has any pending transactions with the system (function 1204). If the user does not have any transactions, the system 100 determines whether a prior transaction has been cancelled (function 1205). If a previous transaction has been cancelled, the system displays a message indicating that the transaction has been cancelled (function 1207). If a transaction has not been cancelled, the system 100 displays a message indicating the absence of any transactions (function 1206). If the user has one or more pending transactions, the system 100 determines whether shipping data has been entered (function 1208). If the transaction has the system 110 displays a message indicating that a transaction has been initiated, for which the shipping data is incomplete (function 1210). If the shipping data has been entered, the system 100 determines whether the payment data for shipping has been completed (function 1212). If the payment data is incomplete, the system 100 displays a message indicating that the shipping data is completed, and the payment data is pending (function 1214). If the payment data is complete, the system 100 determines whether a package level detail (PLD) file (i.e. pick-up information, size/number of packages, etc.) has been created for the transaction (function 1216), and whether the PDL has been forwarded to the carrier (function 1222). If the PDL has not been created, or not been forwarded to the carrier, the system 100 will display a message indicating that payment data is complete and carrier pick-up is pending (function 1218, 1224); and cancellation of the transaction is prohibited (function 1220, 1226). If the PLD file has been forwarded to the carrier, the system 100 determines whether the package has been picked up (function 1228). If the package has not been picked up, the system 100 displays a message indicating that payment data is complete and carrier pickup is pending (function 1230). If the package has been picked up, the system determines whether the package is still in transit to the delivery address (function 1232). If the package is in transit, the system displays a message indicating that the shipment has been picked up by the carrier and is in transit to the delivery address (function 1234). If the shipment is no longer in transit, the system determines whether the package has been delivered (function 1236). If the package has not been delivered, the system 100 determines whether a

1 trace is pending on the package (function 1240). If a trace is pending, the system 100 displays a  
2 message indicating that a trace is in progress (function 1242). If no trace is pending, the system  
3 100 displays a message indicating that the shipment has been picked up by the carrier and is still  
4 in transit (function 1238). If the package has been delivered, the system 100 determines whether  
5 a damage claim is pending on the package (function 1244). If a damage claim is pending, the  
6 system displays a message indicating that a damage claim is pending (function 1246). If no  
7 damage claim is pending, the system 100 determines whether the transaction is complete  
8 (function 1252). If the transaction is complete, the system displays a message indicating that the  
9 transaction is complete (function 1254). If the transaction is not complete, the system displays  
10 the delivery user menu (function 1256) (see Figure 9).

11 Although the present invention has been described in considerable detail with reference  
12 to certain presently preferred versions thereof, other versions are possible without departing  
13 from the spirit and scope of the present invention. Therefore the appended claims should not be  
14 limited to the description of the preferred versions contained herein.

Claims

What is claimed is:

- 1 1. A method of sending an item comprising the steps of:  
2 receiving by a facilitator pick-up information for an item from a first party,  
3 combining facilitator acquired delivery information with the pick-up information to form  
4 a transit information for the item,  
5 communicating the transit information from the facilitator to a commercial carrier, and  
6 transmitting a request from the facilitator to the commercial carrier to pick up the item at  
7 a first location other than the facilitator's location and to deliver the item to a  
8 second location other than the facilitator's location.
- 1 2. A method as claimed in claim 1, wherein the first location is part of the pick-up  
2 information, the second location is part of the delivery information, and the delivery information  
3 is provided by a second party.
- 1 3. A method as claimed in claim 1, wherein the first location is a part of the pick-up  
2 information.
- 1 4. A method as claimed in claim 1, wherein the second location is a part of the delivery  
2 information.
- 1 5. A method as claimed in claim 1, wherein the carrier is selected from a plurality of  
2 delivery services.
- 1 6. A method as claimed in claim 1, further comprising the step of:  
2 receiving credit information to be used for payment to the carrier.
- 1 7. A method as claimed in claim 1, further comprising the step of:  
2 picking up the item by the carrier at the first location and delivering the item to the  
3 second location.

- 1 8. A method as claimed in claim 1, further comprising the steps of:  
2 preparing a label, and  
3 delivering the label to the first location.
- 1 9. A method as claimed in claim 1, further comprising the step of:  
2 notifying the carrier by the facilitator upon recipient rejection of the item.
- 1 10. A method as claimed in claim 9, wherein the item is rejected for being damaged.
- 1 11. A method as claimed in claim 9, wherein the item is rejected for failing to meet the  
2 recipient's expectations.
- 1 12. A method as claimed in claim 1, wherein the first location represents an address provided  
2 by a seller and the second location represents an address provided by a purchaser, and claim 1,  
3 further comprising the step of:  
4 receiving by the facilitator information regarding a sales transaction between the  
5 purchaser and the seller of the item.
- 1 13. A method as claimed in claim 12, further comprising the step of:  
2 providing for a transfer of funds from the purchaser to the seller.
- 1 14. A method as claimed in claim 12, wherein the information regarding the sales transaction  
2 includes a purchase price that is predetermined by the seller and stored within a product profile  
3 table.
- 1 15. A method as claimed in claim 12, further comprising the step of:  
2 negotiating a purchase price for the item.
- 1 16. A method as claimed in claim 12, wherein the address provided by the seller is stored in  
2 a product profile table and the carrier is requested to pick up the item from the stored address.

- 1 17. A method as claimed in claim 12, further comprising the step of:  
2 notifying the seller that a pick-up is scheduled, and  
3 receiving verification from the seller that the item is available for pick-up prior to the  
4 carrier picking up the item from the seller.
- 1 18. A method as claimed in claim 12, further comprising the step of:  
2 receiving a rejection of the item from the purchaser and arranging for re-delivery of the  
3 item to the first location.
- 1 19. A method as claimed in claim 12, wherein the sales transaction is negotiated using a net  
2 venue transaction participant, the participant directing the sales transaction information to the  
3 facilitator, and claim 12, further comprising the steps of:  
4 collecting payments on behalf of the participant, and  
5 transferring the collected payments to the participant.
- 1 20. A method as claimed in claim 12, wherein the information regarding a sales transaction  
2 includes a purchase price, and claim 12, further comprising the step of:  
3 transferring an amount at least equal to the purchase price from a purchaser's financial  
4 account into an escrow account.
- 1 21. A method as claimed in claim 20, further comprising the step of:  
2 transferring at least a portion of the purchase price from the escrow account to a seller's  
3 financial account.
- 1 22. A method as claimed in claim 21, further comprising the step of:  
2 receiving an acceptance of the item from the purchaser prior to the step of transferring  
3 at least a portion of the purchase price from the escrow account to the seller's  
4 financial account.

- 1 23. A method as claimed in claim 22, further comprising the step of:  
2 waiting a predetermined amount of time to receive a notice of rejection from the  
3 purchaser, and  
4 transferring at least a portion of the purchase price from the escrow account to the  
5 seller's financial account upon passage of the predetermined amount of time  
6 without receiving notice of rejection.
- 1 24. A method as claimed in claim 12, wherein the information regarding the sales transaction  
2 includes a purchase offer.
- 1 25. A method as claimed in claim 24, wherein the purchase offer includes a purchase price.
- 1 26. A method as claimed in claim 12, wherein the information regarding the sales transaction  
2 includes a sales offer.
- 1 27. A method as claimed in claim 26, wherein the sales offer includes a sales price.
- 1 28. A method as claimed in claim 12, further comprising the step of:  
2 creating a transaction identification number associated with the sales transaction.
- 1 29. A method as claimed in claim 25, further comprising the step of:  
2 transmitting a request for authorization for credit of a transaction amount against a  
3 purchaser's financial account.
- 1 30. A method as claimed in claim 29, wherein the purchaser's financial account is selected  
2 from the group consisting of credit card account, check card, and electronic check.
- 1 31. A method as claimed in claim 29, wherein the request for authorization is transmitted  
2 prior to notifying the seller of the purchase offer.

- 1 32. A method as claimed in claim 29, wherein the transaction amount comprises the  
2 purchase price, a calculated shipping charge and transaction fees.
- 1 33. A method as claimed in claim 29, further comprising the steps of:  
2 receiving an approved request for authorization, and  
3 notifying the seller that the purchaser is authorized to purchase the item.
- 1 34. A method as claimed in claim 29, further comprising the step of:  
2 receiving an approved request for authorization.
- 1 35. A method as claimed in claim 34, further comprising the step of:  
2 reserving funds in the amount of the transaction amount from the purchaser's financial  
3 account without withdrawing the funds from the purchaser's financial account.
- 1 36. A method as claimed in claim 34, further comprising the step of:  
2 transferring an amount at least equal to the purchase price from the purchaser's financial  
3 account into an escrow account.
- 1 37. A method as claimed in claim 36, further comprising the step of:  
2 transferring at least a portion of the purchase price from the escrow account to a seller's  
3 associated financial account.
- 1 38. A method as claimed in claim 29, wherein the approved request for authorization is for a  
2 period of time, and claim 29, further comprising the step of:  
3 extending the authorization period of time for a re-time period prior to expiration of the  
4 authorization period of time.
- 1 39. A method as claimed in claim 38, further comprising the step of:  
2 canceling an authorization request by providing a re-time period of zero days.

- 1 40. A method of facilitating a transaction comprising the steps of:  
2 transmitting a request for authorization for credit of a transaction amount against a  
3 purchaser's financial account,  
4 receiving an approved request for authorization for a period of time, and  
5 extending the authorization period of time for a re-time period prior to  
6 expiration of the authorization period of time.
- 1 41. A method as claimed in claim 40, wherein the authorization has an associated  
2 authorization number.
- 1 42. A method as claimed in claim 40, wherein the authorization is retained during the  
2 extended period of time.
- 1 43. A method as claimed in claim 40, wherein the step of extending the authorization period  
2 of time is repeated until an occurrence.
- 1 44. A method as claimed in claim 43, wherein the occurrence is a cancellation of the  
2 transaction.
- 1 45. A method as claimed in claim 43, wherein the occurrence is a completed transaction.
- 1 46. A method as claimed in claim 43, wherein the occurrence is a predetermined fulfillment  
2 date.
- 1 47. A method as claimed in claim 40, further comprising the step of:  
2 canceling an authorization request by providing a re-time period of zero days.
- 1 48. A method as claimed in claim 40, wherein the transaction involves the sale of a good.
- 1 49. A method as claimed in claim 40, wherein the transaction involves the sale of a service.

- 1 50. A method as claimed in claim 40, wherein the transaction amount comprises a purchase  
2 price and transaction fees.
- 1 51. A method of providing escrow services for a transaction comprising the steps of:  
2 transferring a transaction amount at least equal to a purchase price from a purchaser's  
3 financial account into an escrow account,  
4 sending at least a portion of the purchase price from the escrow account to a seller's  
5 associated financial account, and  
6 integrating the transferring and sending steps into a purchasing process.
- 1 52. A method as claimed in claim 51, wherein the purchasing process comprises negotiation  
2 between a seller and a purchaser using a net venue transaction participant.
- 1 53. A method as claimed in claim 51, wherein the sending step is performed without  
2 authorization of the purchaser.
- 1 54. A method as claimed in claim 53, wherein the transferring step is performed after a  
2 predesignated time period.
- 1 55. A method as claimed in claim 51, wherein the transaction involves the sale of a good.
- 1 56. A method as claimed in claim 51, wherein the transaction involves the sale of a service.
- 1 57. A method as claimed in claim 51, wherein the transaction amount comprises the  
2 purchase price and transaction fees.

- 1 58. A method of sending an item comprising the steps of:  
2 receiving by a facilitator pick-up information for an item from a first party,  
3 combining facilitator acquired delivery information with the pick-up information to form  
4 a transit information for the item,  
5 communicating the transit information from the facilitator to a commercial carrier, and  
6 transmitting a request from the facilitator to the commercial carrier to pick up the item at  
7 a first location other than the facilitator's location and to deliver the item to a  
8 second location other than the facilitator's location,  
9 wherein the delivery information is provided by the first party.
- 1 59. A method as claimed in claim 58, wherein the first location is a location of the first party.
- 1 60. A method as claimed in claim 58, wherein the second location is a location of the first  
2 party.
- 1 61. A method as claimed in claim 58, wherein a location of the first party is a location other  
2 than the first location and the second location.

1 62. A web-based purchasing method using a networked computer system to facilitate the  
2 purchase of merchandise by a purchaser from a seller, the seller and the purchaser each having  
3 an associated financial account, the computer system comprising a merchandise database having  
4 stored therein a product profile table for the merchandise, the method comprising the steps of:

5 (a) receiving over the network a purchase offer from the purchaser to purchase the  
6 merchandise at a purchase price, the purchase offer associated with the purchaser's financial  
7 account;

8 (b) generating and transmitting a request for authorization for credit against the  
9 purchaser's financial account to a financial institution associated with the purchaser's financial  
10 account to verify that the purchaser has at least the purchase price in the purchaser's financial  
11 account to make the purchase;

12 (c) generating an authorization indicator in response to the request for authorization;

13 (d) reviewing the authorization indicator to verify that the purchaser is authorized to  
14 make the purchase using the purchaser's financial account;

15 (e) transmitting a request to a carrier to pick up the merchandise from an address  
16 specified by the seller;

17 (f) picking up the merchandise from the seller;

18 (g) transferring an amount at least equal to the purchase price from the purchaser's  
19 financial account into an escrow account;

20 (h) delivering the merchandise to the purchaser; and

21 (i) transferring at least a portion of the purchase price from the escrow account to the  
22 seller's associated financial account.
